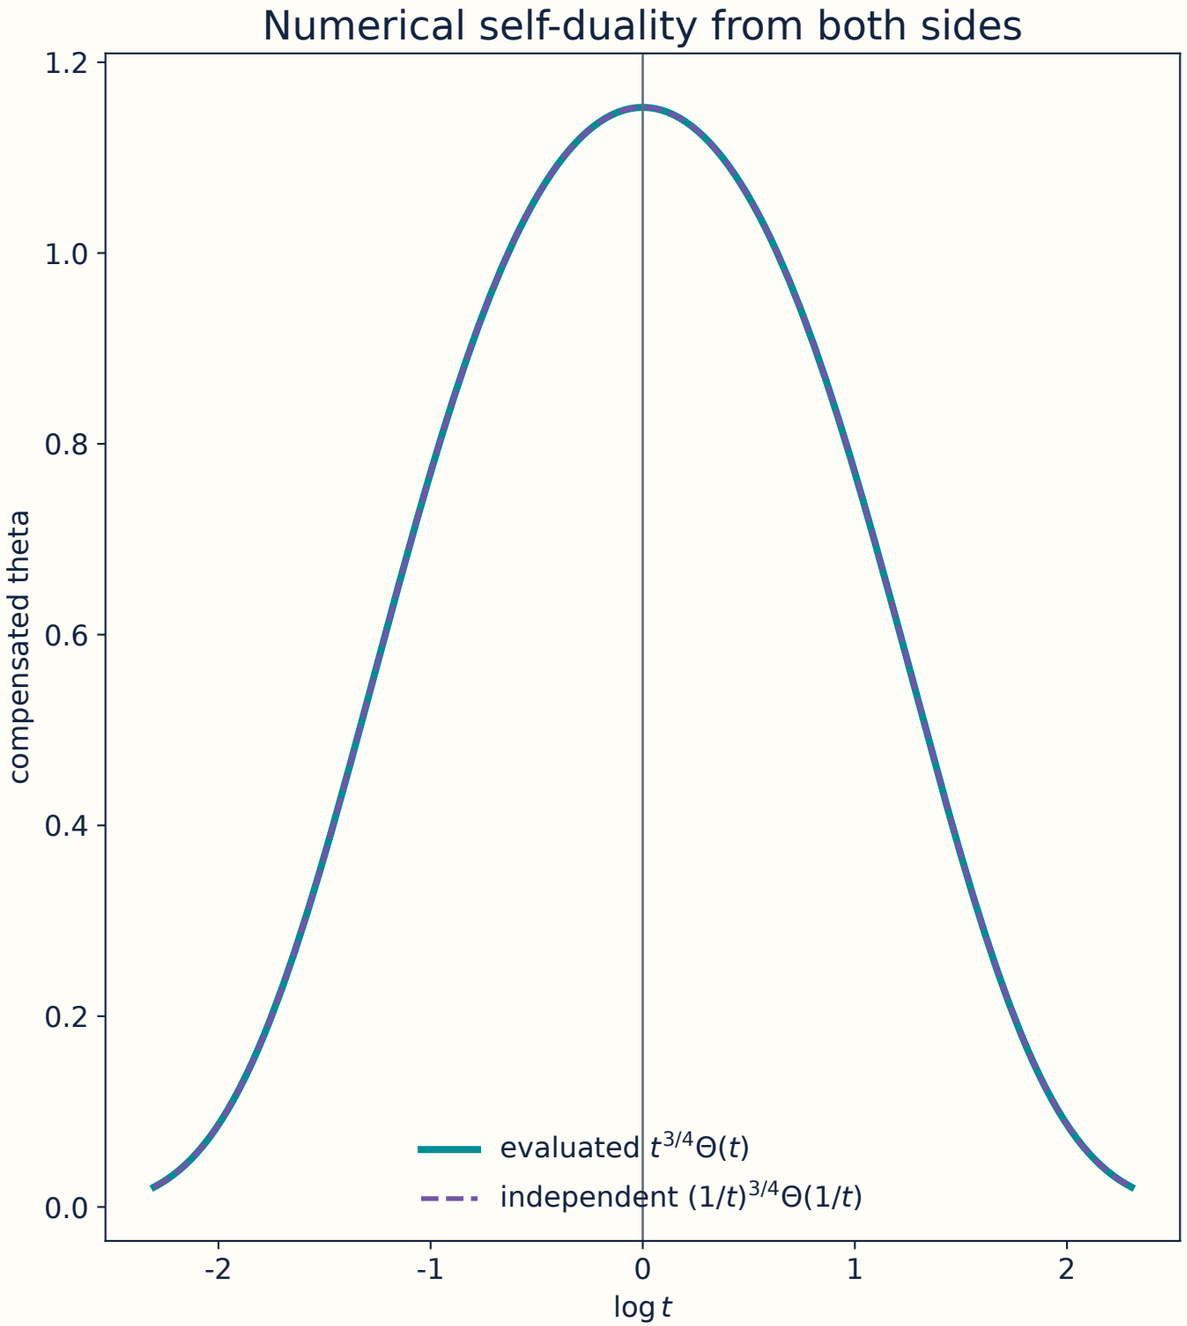
Figure 08. Theta self-duality: a directly evaluated compensated symmetric profile



Golden geometry = gold | Fourier / theta = teal | modular map = violet | CM / Hermite = blue

Gaussian + periodic coefficients

$$\Theta_a(t) = \sum_{n \in Z} n a_n e^{-\pi n^2 t/5}$$

$$\Theta_a(t) = t^{-3/2}\Theta_a(1/t)$$

Both positive and negative n were summed independently for every plotted t.
