

Each forcing annihilator leaves a homogeneous landing, which supplies the next multiplier.

$$E = S + 2, \quad A = -had_\alpha, \quad g_3 = Ex_3, \quad Sg_3 = Ag_3$$

$m_A = Eq \quad (\text{deg} = 6)$

$\downarrow \quad \times E$

$p_3 = E^2q \quad (\text{deg} = 7)$

$\downarrow \quad \times E$

$p_4 = E^3q \quad (\text{deg} = 8)$

$\downarrow \quad \times m_A$

$p_5 = E^4q^2 \quad (\text{deg} = 14)$

$$r_b = m_A(S)x_b, \quad \mathcal{R}_b = \mathbb{C}[S]r_b$$

$\mathcal{R}_3 \simeq \mathbb{C}[S]/(E)$ 

dim 1

$\mathcal{R}_4 \simeq \mathbb{C}[S]/(E^2)$ 

dim 2

$\mu_{\mathcal{R}_5} = E^3q$ 

dim 8

$$q(S) = S^5 - 4S^4 + 12S^3 - 32S^2 + 80S - 192$$
