

The weak equations are affine-linear; strictness adds the unital bimodule relations.

$$\mathfrak{W}(B) = (L_0, R_0) + \ker \mathcal{O}_B$$

Assume the weak fiber is nonempty

$$\mathbf{R}_B \subseteq \mathfrak{W}(B)$$

$$L(1) = R(1) = I_V$$

$$L(ab) = L(a)L(b), \quad R(ab) = R(b)R(a)$$

$$[L(a), R(b)] = 0$$

Fixed-B gauge

$$G_B = \{g \in \mathrm{GL}(V) : gB = B\}$$

$$V = \mathrm{span} B(A, A)$$

$$\implies G_B = \{I_V\}$$

$$T_p \mathbf{R}_B = \ker \mathcal{D}_p$$

$$\ker \mathcal{D}_p = 0$$

implies a reduced isolated point

Weak uniqueness: $\ker \mathcal{O}_B = 0$. Strict local rigidity and global uniqueness are different questions.
