

The same reduced line can carry very different transverse nilpotent structure.

Square-zero mixed example

$$\mathbb{C}[u, v]/(uv, v^2)$$

Transverse direction only at $u = 0$

$$uv = 0, \quad v^2 = 0$$

$$\dim \text{Obs}_p^{\text{eff}} = 2$$

Genuinely cubic formal germ

$$\mathbb{C}[[u, v]]/(v^3)$$

Uniform cubic thickness

$$v^3 = 0, \quad v^2 \neq 0$$

$$\dim \text{Obs}_p^{\text{eff}} = 1$$

Schematic support and thickness; the cubic germ is not three intersecting branches.
