

The special fiber changes embedding dimension while preserving scheme-theoretic length.

$$\mathcal{A} = \mathbb{C}[u, e, v]/(e^2, ev, q_u e + 3v^2), \quad q_u := 1 + 2u$$

$$\mathcal{A} \simeq \mathbb{C}[u]^{\oplus 3} \text{ } (\mathbb{C}[u]\text{-modules}), \quad \text{basis } (1, v, e)$$

$$q_u \neq 0: \quad \mathbb{C}[v]/(v^3)$$

$$1 \longrightarrow v \longrightarrow v^2 \longrightarrow 0$$

length 3 • embedding dimension 1

$$q_u = 0: \quad \mathbb{C}[e, v]/(e, v)^2$$

$$1 \begin{matrix} \nearrow v \\ \searrow e \end{matrix} \quad (e, v)^2 = 0$$

length 3 • embedding dimension 2

Multiplication diagrams on a basis; all fibers have a single geometric support point.
