

$$dE = -\xi \smile \xi, \quad D_\alpha E = 2dE, \quad h(dE) = E$$

Normalized E -rail in $\mathcal{R} \subset C^1$

Boundary-valued sequence in $B^2 \subset C^2$

$$A^n E = (-2)^n E, \quad D_\alpha A^n E = 2(-2)^n dE \quad (n \geq 0)$$

These identities hold for every normalized internal tilt.
